Geographic view withheld pending validation

The original geographic map is preserved in Flight-Insights-Original.pdf. Its wrapped map tiles and Antarctica classification require source-data normalization and map-projection validation before geographic conclusions are presented as decision-ready insights.

Recommended remediation:

- Standardize country, state and location values.
- Validate coordinates and exclude invalid or unmatched records.
- Rebuild the map with a single-world projection and documented measures.
- Reconcile geographic totals against the underlying incident dataset.
